

Mouse Sensitivity Changes When Running AWR Design Environment

Problem

Running AWR Design Environment may change your mouse sensitivity.

If you experience a change in your mouse sensitivity, such as a slow down in speed when running AWR Design Environment, it can be due to the mouse properties.

Solution

If your mouse has "Disable acceleration in games" option, you should uncheck it. You need to bring up your "Mouse Properties" from Control Panel. The next steps can be different depending on your system. An example is illustrated below: on the "Motion" tab, uncheck the box for "Disable acceleration in game".
