

# IntelliSense Is Not Working in Visual Basic Editor

## Problem

IntelliSense provides word completion when editing scripts. Sometimes this capability does not work properly.

## Solution

You may need to re-register `sb6ent.ocx` . It is recommended that you close the AWRDE first.

To perform the re-regisration:

1. Open a command prompt (Start > Run and type " `CMD` " in the window).
2. In the command window, type `cd` followed by the path to your install directory (for example type `cd C:\Program Files (x86)\AWR\AWRDE\XX` ).
3. Type `regsvr32 sb6ent.ocx` and select Enter.
4. You should see a RegSvr32 window with with message "DLLRegisterServer in sbSvr32 succeeded."
5. Select OK to exit the RegSvr32 window.
6. Restart AWRDE.

If your Computer Operating System is Windows7, you will need to change the properties on `CMD.exe` .

To do this:

1. Select Start> My Computer > Local Disk (C:) > Windows > System32 and scroll down to `CMD.exe` .
2. Right click and Run as Administrator.

If the series of steps listed above does not fix the problem, send a message to [Getting AWR Technical Support](#) and mention that you are having trouble using IntelliSense with scripting.
