Unable to Use Scripting Environment or Run Scripts in Windows 10

Problem

I can not bring up the scripting environment or run a script in Windows 10

Solution

Anti-virus (AV) software may be blocking the ScriptingEnv.exe application installed with AWR Design Environment. If so, an exception needs to be added to allow it to run. The required settings may not be accessible or editable on corporate network PCs (please check with your IT department). Instructions on how to allow an application to run by adding an exclusion in Windows Defender are described here: Add an exclusion to Windows Security
